(54) Title: COMPOSITIONS COMPRISING CYCLODEXTRINS AND NO-RELEASING DRUGS

(57) Abstract: The present invention relates to composition comprising cyclodextrins and a NO-releasing drug of formula, A-X-L-NO<sub>n</sub>, wherein A is the radical deriving from a drug; X is a divalent radical connecting A with the NO-releasing group L-NO<sub>n</sub>; L is selected from the group consisting of: O and S; n is 1 or 2.

## Compositions comprising cyclodextrins and NO-releasing drugs

### Field of the Invention

The present invention relates to compositions comprising a NO-releasing derivative of a  
5 pharmaceutically active compound.

### Background of the Invention

In the last decade there has been a growing interest towards the preparation and the properties  
of compounds comprising a radical derived from a compound having pharmaceutical activity  
and a NO releasing group.

10 EP 670 82, EP 759 899 and EP 722 434 disclose nitric esters of non-steroidal  
antiinflammatory drugs (NSAIDs). These compounds present an improved activity and  
reduced side effects when compared to the drug without NO-releasing group.

WO 98/15568 discloses nitrate esters of corticoids. Also in this case a reduced toxicity is  
observed when the nitrate group is present.

15 Compounds comprising a radical derived from an antithrombotic drug and a NO-releasing  
group are described in WO 98/21193. The comparative data show that the introduction of the  
NO-releasing group causes an increase of activity of the drug.

WO 00/61537 discloses the preparation of drugs comprising a NO releasing group linked to,  
inter alia, anti-inflammatory, analgesic, bronchodilators, ACE-inhibitors,  $\beta$ -blockers,  
20 antineoplastic compounds. The use of a linking group presenting specific antioxidant  
properties allows the use of these drugs to patients affected by oxidative stress and/or  
endothelial dysfunction.

Thus, it is possible to say that the introduction of NO releasing groups has proven to be  
advantageous in many classes of drugs. However, the introduction of a NO releasing group  
25 often leads to a relevant drawback, i.e. a significant reduction in water solubility, that might  
lead to a slower adsorption rate of the drug in the human body. It is therefore desirable to find  
methods to improve the bioavailability of compounds comprising a radical derived from a  
compound having pharmaceutical activity and a NO-releasing group.

The use of cyclodextrin complexes in combination with NO releasing compounds is known  
30 from WO 95/29172. In that case, however, there was no radical derived from a compound  
having pharmaceutical activity in the molecule complexed with Cyclodextrin and,  
furthermore, the problem was to render the molecule stable to degradation. Thus, both the

type of compound and the technical problem solved by the patent application are quite different from the present case.

#### Summary of the invention

The present invention relates to compositions for pharmaceutical use comprising a cyclodextrin and a compound comprising a radical derived from a compound having pharmaceutical activity and a NO releasing group.

#### Detailed description of the invention

The invention relates to compositions comprising cyclodextrins and a NO-releasing drug of formula

wherein A is the radical deriving from a drug;

X is a divalent radical connecting A with the NO-releasing group;

L is selected from the group consisting of: O and S; preferably it is O;

n is 1 or 2, preferably it is 2.

15                    The syntheses of these compounds is described in the following patents, which are herewith incorporated by reference: US 5,861,426, WO 98/15568, US 5,621,000, WO 00/61537, WO 00/61541, WO 00/61604, US 5,703,073, US 6,043,233, US 6,057,347.

Cyclodextrins are cyclic oligosaccharides constituted by the union of from 6 to 12 glucose units through α(1,4) bonds. The word CD, used to indicate them, is usually preceded by a

20                    Greek letter that indicates the amount of glucose units (α corresponds to 6, β corresponds to 7, and so on).

A characteristic parameter of CDs is the diameter of the cavity wherein the compound is complexed.

For many purposes α-CD have a too small cavity (5 Å) to complex molecules of a medium size. This is why for many applications β-CD is preferred (diameter: 6 Å). The drawback of β-

CD is its low solubility in water (18.5 g/l). To overcome the problem, probably caused by inter- and intramolecular hydrogen bonds between the hydroxyl groups, β CD derivatives have been prepared which present a considerably higher water solubility. In fact, it is known that the hydroxyl groups in the glucose units of CDs can be selectively reacted to prepare

30                    ethers, esters, ionic ethers (see for example the review "Physicochemical Characteristics and Pharmaceutical uses of Cyclodextrin Derivatives" D. Duchene et al., Pharmaceutical Technology International, June 1990).

The cyclodextrins to be used in combination with the compounds of formula A-X-L-NO<sub>n</sub> are not particularly limited. Preferred examples of cyclodextrins useful in the present invention are: α-CD, dimethyl α-CD, trimethyl α-CD, β-CD, dimethyl β-CD, trimethyl β-CD, 2-hydroxypropyl β-CD, 3-hydroxypropyl β-CD, 2,3-dihydroxypropyl β-CD, γ-CD, dimethyl γ-CD, trimethyl γ-CD and polymeric CD.

In each particular case, it is possible to determine, with a few trials, which one is the most suitable cyclodextrin to be used in combination with a specific drug.

The molar ratio between the drug and the cyclodextrin can vary in a broad range. Preferably it is comprised between 1:10 and 10:1, more preferably between 3:1 and 1:3.

10 The composition according to the invention can be prepared in different ways. For example, it is possible to mix together the cyclodextrin and the NO-releasing drug in water. Due to the low solubility of most drugs, the drug is partly or fully dissolved when complexed with the CD. The solution is then dried and the solid recovered. It is also possible to use a cosolvent (e.g. ethanol) which is miscible with water and that solubilizes the drug. In another 15 embodiment it is also possible to isolate the pure complex by using a two phase system: a lipophilic solvent wherein the drug is soluble, and water. The CD dissolves in the water phase, the drug in the lipophilic phase. The complex CD-drug is formed at the interphase. If it is soluble in water, it is recovered from the water phase.

Finally, it is also possible to simply mix the drug and the CD in the solid state by using 20 mixing and/or milling means well known in the art.

In a preferred embodiment, the drug used in the compositions according to the present invention, is selected from the following classes of compounds:

### Experimental

#### **Example 1**

- 20 Male Guinea pigs (weighing 300 to 500 g) were killed by a blow on the neck and exsanguinated. Urinary bladders were cut into strip preparations (3x12 mm). Guinea-pig bladder strips were rapidly transferred to jacketed tissue baths (25 ml) and mounted between two hooks. One the hooks was connected to a force transducer (Gould UC2). The strips were maintained at 37°C in a physiological salt solution. (PSS) that contains the following components: NaCl (119 mM), KCl (4.6 mM), CaCl<sub>2</sub> (1.5 mM), MgCl<sub>2</sub> (1.2 mM), NaHCO<sub>3</sub> (20 mM), NaH<sub>2</sub>PO<sub>4</sub> (1.4 mM) and glucose (11 mM). The solution was gassed with a 95/5 mixture of O<sub>2</sub>/CO<sub>2</sub> until a pH of 7.4 was achieved. A tension of 0.5 g was initially applied to each preparation. During stabilization (40-60') the strips were repeatedly washed and the tension was adjusted. Tissue contraction was induced by corbachol 3x10<sup>-6</sup> M.
- 25 The experiment compares the inhibition of contraction obtained by using a solution of the composition according to the invention with the effect achieved by the same drug without cyclodextrin. FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

Continuation of Box I.2

Present claims 1-10 relate to an extremely large number of possible compounds. In fact, the claims contain so many variables or possible permutations that a lack of clarity (and/or conciseness) within the meaning of Article 6 PCT arises to such an extent as to render a meaningful search of the claims impossible. Consequently, the search has been carried out for those parts of the application which do appear to be clear (and/or concise), namely the examples and closely related homologous compounds.

The applicant's attention is drawn to the fact that claims, or parts of claims, relating to inventions in respect of which no international search report has been established need not be the subject of an international preliminary examination (Rule 66.1(e) PCT). The applicant is advised that the EPO policy when acting as an International Preliminary Examining Authority is normally not to carry out a preliminary examination on matter which has not been searched. This is the case irrespective of whether or not the claims are amended following receipt of the search report or during any Chapter II procedure.
